---

## ALA-1

### ❖ Python Error File :

```
print("Voting Analytics")

candidates = int(input("Enter candidate count: "))

i = 0

highest = 0

winner = 0

while i < candidates:

    votes = int(input("Enter votes: ")) i

    f votes > highest:

        highest = votes

        winner = i

    i = i + 1 print("Winner index:", winner)

print("Highest votes:", highest

if highest = 0:

    print("No votes cast")

if candidates <= 0:

    print("Invalid candidate number")
```

## ❖ ERROR & SOLUTION

1) Everything written in one line original code:

➤ `print("Voting Analytics") candidates = int(input("Enter candidate count: "))`

☞ Python requires each statement on a new line.

---

2) Missing indentation inside while

➤ `while i < candidates:`  
`votes = int(input("Enter votes: "))`

☞ The votes line must be indented inside the loop.

---

3) Missing indentation inside if

➤ `if votes > highest:`  
`highest = votes`  
`winner = i`

☞ Both lines must be indented under if.

---

4) Wrong comparison operator

➤ `if highest = 0:`

✗ = is assignment

☒ == is comparison

Correct:

`if highest == 0:`

---

5) Missing closing bracket

➤ `print("Highest votes:", highest`

☞ You forgot ).

---

6) Logical issue – validation placed at wrong position

➤ `if candidates <= 0:`

☞ This should be checked before running the loop, not after.

---

### 7) Minor Improvement

➤ winner = 0

Better to initialize:

winner = -1

---

## ❖ Python Solution File :

```
print("Voting Analytics")

candidates = int(input("Enter candidate count: "))

if candidates <= 0:

    print("Invalid candidate number")

else:

    i = 0

    highest = 0

    winner = -1  # -1 means no winner yet

    while i < candidates:

        votes = int(input("Enter votes: "))

        if votes > highest:

            highest = votes

            winner = i

        i = i + 1

    print("Winner index:", winner)

    print("Highest votes:", highest)

    if highest == 0:

        print("No votes cast")
```

## ❖ Python Code Output Image :

The screenshot displays the PyCharm IDE interface. The left sidebar shows the project structure for 'parva' located at 'C:\Users\DELL\Desktop\parva'. The main editor window shows the file 'solution.py' with the following Python code:

```
1 print("Voting Analytics")
2 candidates = int(input("Enter candidate count: "))
3 if candidates <= 0:
4     print("Invalid candidate number")
5 else:
6     i = 0
7     highest = 0
8     winner = -1 # -1 means no winner yet
9     while i < candidates:
10         votes = int(input("Enter votes: "))
11         if votes > highest:
12             highest = votes
13             winner = i
14         i = i + 1
15     print("Winner index:", winner)
16     print("Highest votes:", highest)
17     if highest == 0:
18         print("No votes cast")
19
```

The bottom panel shows the output of the program:

```
Run solution
C:\Users\DELL\Desktop\parva\.venv\Scripts\python.exe C:\Users\DELL\Desktop\parva\solution.py
Voting Analytics
Enter candidate count: 3
Enter votes: 1
Enter votes: 5
Enter votes: 2
Winner index: 1
Highest votes: 5
```

The status bar at the bottom indicates the project is 'Analyzing project...', the file encoding is 'UTF-8', and the Python version is 'Python 3.14 (parva)'.
